A prospective, multicenter randomized phase III clinical trial of intensified chemotherapy in improving the treatment efficacy of patient with diffuse large B-cell lymphoma

Applicant institution: Sun Yat-Sen University Cancer Center

Applicant institution: Sun Yat-Sen University Cancer Center

Version: 2.0

Date: 20110113

Remark: the primary version of this protocol was in Chinese. We have translated it into English.

121

122 **List Of Abbreviations**

ADCC	Antibody-Dependent Cell-mediated Cytotoxicity
AE	Adverse Event
ALT	Alanine aminotransferase
AST	Aspartate aminotransferase
CDCC	Complement-Dependent Cytotoxicity
CHOP	Cyclophosphamide, Doxorubicin, Vincristine, Prednisone
CHOP-14	CHOP given every 2 weeks
CHOP-21	CHOP given every 3 weeks
CR	Complete Remission
CRR	Complete Remission Rate
CRF	Case Report Form
CT	Computerized Tomography
CTCAE	Common Terminology Criteria for Adverse Events
DFS	Disease Free Survival
DLBCL	Diffuse Large B-cell Lymphoma
ECOG	Eastern Cooperative Oncology Group
GCP	Good Clinical Practice
IPI	International Prognostic Index
ITT	Intent-To-Treat
G-CSF	Granulocyte Colony-Stimulating Factor
MRI	Magnetic Resonance Imaging
NCCN	National Comprehensive Cancer Network
NCI	National Cancer Institute
NHL	Non-Hodgkin Lymphoma

OS	Overall Survival
ORR	Overall Response Rate
PD	Progressive Disease
PP	Per Protocol
PR	Partial Remission
R-CHOP	Rituximab, Cyclophosphamide, Doxorubicin, Vincristine, Prednisone
R-CHOP-14	R-CHOP given every 2 weeks
R-CHOP-21	R-CHOP given every 3 weeks
SAE	Serious Adverse Event
SD	Stable Disease

154

Protocol Summary

Applicant	Sun Yat-Sen University Cancer Center
Phase	Phase III
Indication	Newly diagnosed diffuse large B-cell lymphoma
Objectives	Compare 5-year DFS rate between R-CHOP-21 group and R-CHOP-14 group; Compare ORR, CRR, OS and safety between the two groups.
Study design	prospective, multi-center, parallel, controlled, open-label, randomized phase III study
Subjects required	454 subjects
Study sites	10 study sites (Sun Yat-Sen University Cancer Center, The First Affiliated Hospital of Sun Yat-sen University, The Third Affiliated Hospital of Sun Yat-sen University, The Fifth Affiliated Hospital of Sun Yat-sen University, Beijing Cancer Hospital, Southern Hospital of Southern Medical University, The First People's Hospital of Foshan, People's Hospital of Zhongshan, Shantou University Medical College and Kiang Wu Hospital)
Screening Criteria	Newly diagnosed DLBCL adult subjects without treatment contraindication
Study duration	The enrolment of the study will start from January, 2011 and end at December, 2018
Control Group	R-CHOP given every 3 weeks for a total of 3-8 cycles
Experimental Group	R-CHOP given every 2 weeks for a total of 3-8 cycles
Primary endpoint	5-year disease free survival (DFS)
Secondary endpoints	ORR, CRR, OS and safety
Study procedures	<p>This is a prospective, multi-center, parallel, controlled, open-label, randomized phase III study. A total of 454 subjects with newly diagnosed diffuse large B-cell lymphoma meeting the inclusion criteria is required. After giving written informed consent, all subjects will be randomized to R-CHOP-21 group or R-CHOP-14 group</p> <p>Subjects will receive safety assessments after every cycle of chemotherapy and efficacy assessments after every two cycles of chemotherapy. Follow-up period starts after the completion of chemotherapy and follow-up visits will be performed every three months.</p>

Statistical Analysis 454 subjects with newly diagnosed DLBCL will be randomized to two groups at a 1:1 scheme. The ORR and CRR will be compared between the two groups on ITT and PP population. All AEs of the study will be analyzed.

155

156

157 **1. Background**

158 There are several known prognostic factors for non-Hodgkin lymphoma (NHL). Besides histologic
159 subtype, the prognosis of NHL is mainly related to clinical characteristics such as International
160 Prognostic Index (IPI), which is also suitable for predicting the outcome of Chinese patients with
161 diffuse large B-cell lymphoma (DLBCL) and distinguishing high-risk patients with poor response to
162 conventional chemotherapy. In pre-rituximab era, the CHOP (cyclophosphamide, doxorubicin,
163 vincristine, and prednisone) regimen given every 3 weeks (CHOP-21) was standard care for
164 aggressive NHL. On the basis of the high proliferation rate of tumor cells in patients with
165 aggressive NHL and the significant maturity of blast neutrophile granulocytes stimulated by
166 granulocyte colony-stimulating factor (G-CSF) in preclinical studies, we have reduced treatment
167 intervals from 3 to 2 weeks (CHOP-14) with prophylactic use of G-CSF and demonstrated that
168 CHOP-14 significantly improved 5-year disease-free-survival rate compared to standard CHOP-21
169 (31.46% vs. 12.5%) in randomized study in high-risk DLBCL patients. Similar findings were
170 reported in recent studies performed in America, Japan and Europe. Concurrent with the result,
171 the dose-intense regimen CHOP-14 also improved outcome of DLBCL patients with low IPI.

172 Rituximab, a human-mouse chimeric monoclonal antibody that binds specifically to the
173 CD20 antigen located on B lymphocytes, can induce CD20-positive B-cell depletion as a result of
174 antibody-dependent cell-mediated cytotoxicity (ADCC) and complement-dependent
175 cytotoxicity (CDCC). During the period from 2003 to 2005, several international, multi-center,
176 randomized clinical trials have confirmed that rituximab in combination with CHOP-21
177 (R-CHOP-21) significantly improved response rate and overall survival compared to CHOP-21
178 alone in DLBCL patients without additional serious toxicity. Similar results were achieved in
179 Chinese patients. Consequently, both CHOP-14 and R-CHOP-21 have been the most outstanding
180 advances in the treatment of DLBCL recently.

181 Both CHOP-14 and R-CHOP-21 improved outcome of DLBCL. However, whether rituximab

182 combined with CHOP-14 (R-CHOP-14) would improve survival is undetermined. From January
183 2008, the principal investigator conducted a multi-center, prospective, controlled, randomized
184 phase III clinical trial (5010 project) to compare the efficacy and safety of first-line treatment
185 with R-CHOP-21, R-CHOP-14 and CHOP-14 in adult patients with previously untreated DLBCL. In
186 August 2010, analysis based on 163 subjects in Sun Yat-Sen University Cancer Center indicated
187 that regimens containing rituximab, both R-CHOP-21 and R-CHOP-14, significantly improved
188 short-term efficacy in contrast to CHOP-14 and R-CHOP-14 tended to improve survival compared
189 with R-CHOP-21. Both the preliminary result of our study and the findings of recent international
190 studies indicated that CHOP-14 was inferior to R-CHOP every 2 or 3 weeks, despite its superior
191 efficacy to CHOP-21. So CHOP-14 was no longer considered as a standard treatment for DLBCL in
192 the NCCN guideline since 2009 (economic reasons were preclusive). Consequently, we
193 terminated the enrolment and randomization of CHOP-14 group from the view of ethics.
194 However, whether R-CHOP-14 is more effective than R-CHOP-21 in adult patients with newly
195 diagnosed DLBCL, high-risk patients would benefit from shortening treatment intervals and
196 Chinese patients could tolerate dose-intense regimen R-CHOP-14 are uncertain. In order to
197 administrate and control the quality of this study, the original 42 participating centers were
198 reduced to 12 centers including four subsidiary hospitals of Sun Yat-Sen University and another 8
199 hospitals in GuangZhou.

200 On the basis of our previous studies, we prepare to investigate the efficacy and safety of
201 R-CHOP-14 as the first-line treatment for CD20-positive untreated DLBCL with G-CSF prophylaxis
202 in a multi-center, prospective, controlled, randomized phase III clinical trial. The early-phase
203 study of this trial has been registered on the website of <http://clinicaltrials.gov/>.

204 **2. Objectives**

205 **2.1. Primary Objective**

206 The primary objective of the study is to compare 5-year disease free survival (DFS) rate following
207 treatment with R-CHOP chemotherapy every three weeks versus every two weeks in subjects
208 with untreated CD20-positive diffuse large B-cell lymphoma.

209 **2.2. Secondary Objectives**

210 The secondary objective is to compare overall response rate (ORR), complete remission rate
211 (CRR), overall survival (OS) and safety following treatment with R-CHOP chemotherapy every
212 three weeks versus every two weeks in subjects with untreated CD20-positive diffuse large B-cell
213 lymphoma.

214 **3. Study Design**

215 This is a prospective, multi-center, parallel, controlled, open-label, randomized (1:1) phase III
216 study of treatment with R-CHOP regimen every 3 weeks (R-CHOP-21 group) compared to
217 treatment with R-CHOP regimen every 2 weeks (R-CHOP-14 group) in subjects with untreated
218 CD20-positive diffuse large B-cell lymphoma.

219 Subjects with early-stage disease will receive a total of 3 to 6 cycles of R-CHOP chemotherapy.
220 Subjects with advanced-stage disease will receive a total of 6 to 8 cycles of R-CHOP
221 chemotherapy. After the completion of chemotherapy, additional radiation therapy will be added
222 to subjects with early-stage or residual disease.

223 **Screening:**

224 The subjects or their legally acceptable representative will provide written informed consent. A
225 history, physical examination, ECOG performance status, laboratory studies including blood
226 routine, blood biochemistry, urinalysis and pregnancy test, electrocardiogram, CT imaging and
227 bone marrow biopsy will be performed to determine baseline disease status and study eligibility,
228 all of which must be performed ≤ 14 days prior to randomization.

229 **Treatment:**

230 Based upon their assignment, subjects will receive a standard R-CHOP regimen repeated every 2
231 or 3 weeks, which comprised rituximab (375 mg per square meter of body-surface area given
232 intravenously on day 1), cyclophosphamide (750 mg per square meter given intravenously on day
233 2), doxorubicin (50 mg per square meter given intravenously on day 2), vincristine (1.4 mg per
234 square meter given intravenously on day 2, up to a maximal dose of 2 mg), and prednisone (60
235 mg per square meter given orally per day for 5 days). Subjects with early-stage disease will
236 receive a total of 3 to 6 cycles of R-CHOP chemotherapy. Subjects with advanced-stage disease
237 will receive a total of 6 to 8 cycles of R-CHOP chemotherapy. After the completion of
238 chemotherapy, additional radiation therapy will be added to subjects with early-stage or residual

239 disease. The dose of radiotherapy is 30-40 Gray.

240 **4.Subject Selection Criteria**

241 **4.1. Subject Selection Criteria**

242 **4.1.1 Number Of Subjects**

243 A total of 454 subjects will be randomized to R-CHOP-21 group or R-CHOP-14 group.

244 **4.1.2 Inclusion Criteria**

245 Subjects eligible for enrolment in this study must meet all of the following criteria:

246 1. Age \geq 18 years

247 2. Histologically confirmed CD20(+) diffuse large B-cell lymphoma defined according to WHO
248 classification

249 3. No previous treatments including radiotherapy, chemotherapy and surgery

250 4. Radiographically measurable disease, defined as:

251 1) 2 or more clearly demarcated lesions/nodes with a long axis $>$ 1.5 cm and short axis \geq
252 1.0 cm

253 OR

254 2) 1 clearly demarcated lesion/node with a long axis $>$ 2.0 cm and short axis \geq 1.0 cm

255 5. ECOG performance status of 0, 1, 2, or 3

256 6. Life expectancy of at least 3 months in the opinion of the investigator

257 7. Normal bone marrow function (WBC \geq 3.5 \times 10⁹/L, HGB $>$ 100 g/L, PLT $>$ 90 \times 10¹²/L)

258 8. Normal liver and renal function

259 9. No history of other malignancies

260 10. No other serious diseases which conflict with the treatment in the present study

261 11. No concurrent treatments that conflict with the treatments in the present study (including
262 steroids)

263 12. Patients should understand and are willing to participate in the study. Inform consent form is
264 supposed to obtained before treatment

265 13. All patients should consent to adopt efficient contraception methods during the treatment

266 and 6 months after completion of the treatment. The pregnancy tests of women of childbearing
267 potential should be negative before the treatment

268 **4.1.3 Exclusion Criteria**

269 Subjects meeting any of the following criteria are ineligible for this study:

- 270 1. Current or previous participation in the treatment phase of another interventional clinical
271 study within 3 months prior to randomization
- 272 2. Lymphomas secondary to chemotherapy or radiotherapy for other malignancies
- 273 3. Secondary, transformed, relapsed, or refractory lymphoma
- 274 4. Primary central nervous system lymphoma or testicular lymphoma
- 275 5. History of allergic reaction to any ectogenic protein
- 276 6. Any previous treatments for lymphoma
- 277 7. History of other malignancies
- 278 8. Screening laboratory values:
 - 279 1) Neutrophils $<1.0 \times 10^9/L$
 - 280 2) Hemoglobin $<80g/L$
 - 281 3) Platelets $<90 \times 10^9/L$
- 282 9. Concurrent severe or active infectious disease requiring systemic antibiotics or antiviral,
283 antifungal treatment
- 284 10. Uncompensated heart failure, dilated cardiomyopathy, coronary heart disease with ST
285 segment depression on electrocardiography, or myocardial infarction in the past 6 months
- 286 11. Renal insufficiency not related to lymphoma (creatinine $\geq 2 \times$ upper limit of normal)
- 287 12. Hepatic insufficiency not related to lymphoma (transaminase $\geq 3 \times$ upper limit of normal,
288 and/or total bilirubin $\geq 2.0mg/dl$)
- 289 13. Clinical symptoms of cerebral dysfunction; Severe psychiatric disease
- 290 14. Female patients who are lactating or pregnant
- 291 15. Known or suspected inability to fully comply with study protocol

292 **4.2. Removal Criteria**

293 Subjects who have participated in the study will be removed from statistical analysis for the
294 following reasons:

- 295 1. Subjects who are ineligible for this study
 296 2. Continuous treatment less than 2 cycles and objective response can not be assessed, but AE
 297 can be assessed
 298 3. Deviation(s) from the protocol

299 **4.3. Withdrawal Criteria**

300 Subjects will be withdrawn from study treatment and visits for any of the following:

- 301 1. Inability to fully comply with study protocol
 302 2. Initiation of alternative anti-lymphoma treatment, which will influence the assessment of
 303 response
 304 3. Unacceptable toxicity
 305 4. Best interest of the subject based upon the investigator’s discretion
 306 5. At the request of the study subject at any time and for any reason

307 The reason for withdrawal from study participation and the date must be documented in the CRF.

308 The investigator must perform the last visit, including disease, response and AE assessment, all of
 309 which must be documented in the CRF.

310 **5. Study Procedures**

311 **5.1. Treatment Assignment**

312 Subjects will be identified by a unique subject number that will remain consistent for the
 313 duration of the study. Upon completion of all the required screening assessments, eligible
 314 subjects will be centrally randomized using a randomization schedule generated by Sun Yat-sen
 315 University Cancer Center statistical department, which will assign subjects in a 1:1 ratio to
 316 R-CHOP-21 group or R-CHOP-14 group.

317 **5.2. Study treatment**

318 **5.2.1. R-CHOP-21 Group (Rituximab In Combination With CHOP)**

drugs	dose	route	time
Rituximab (R)	375mg/m ²	intravenous	Day 1
Cyclophosphamide (C)	750mg/m ²	intravenous	Day 2
Doxorubicin (H)	50mg/m ²	intravenous	Day 2

Vincristine (O)	2mg/m ² (up to a maximal dose of 2 mg)	intravenous	Day 2
Prednisone (P)	60mg/m ²	oral	Day2-6

319 Time for next dose: day 22

320 Total cycles: 3-6 cycles for early-stage disease and 6-8 cycles for advanced-stage disease

321 **5.2.2. R-CHOP-14 Group (Rituximab In Combination With CHOP)**

drugs	dose	route	time
Rituximab (R)	375mg/m ²	intravenous	Day 1
Cyclophosphamide (C)	750mg/m ²	intravenous	Day 2
Doxorubicin (H)	50mg/m ²	intravenous	Day 2
Vincristine (O)	2mg/m ² (up to a maximal dose of 2 mg)	intravenous	Day 2
Prednisone (P)	60mg/m ²	oral	Day2-6

322 Time for next dose: day 15

323 Total cycles: 3-6 cycles for early-stage disease and 6-8 cycles for advanced-stage disease

324 Granulocyte colony-stimulating factor will be given subcutaneously at a dose of 1.0 to 2.0 ug per
325 kilogram of the body weight daily from day 7 for 6 to 8 days.

326 **6. Criteria Of Continuous Treatment**

327 Subjects meeting all of the following criteria will receive next dose on schedule:

328 1. Neutrophils and platelets recover after the low ebb of bone marrow suppression

329 2. Neutrophils > 1.5×10⁹/L on day 1 of next cycle

330 3. Platelets > 100×10¹²/L on day 1 of next cycle

331 If the critical values can not be reached, next dose must be delayed until recovery of neutrophils
332 and platelets. Subjects whose treatment is delayed more than 21 days due to hematological
333 toxicity will be withdrawn from the study treatment and the AE must be documented in the CRF.

334 **7. Rules Of Dosage Adjustment To Cytotoxic Drugs**

335 Dosage adjustment to cytotoxic drugs is not allowed only if next cycle be delayed more than 7
336 days due to neutropenia or thrombocytopenia.

337 If the treatment is delayed more than 7 days between two continuous cycles due to neutropenia
338 or thrombocytopenia, hematology analysis will be repeated every 3 to 4 days until neutrophils
339 and platelets recover to the critical values above, and the dosage of cytotoxic drugs in the next
340 cycle will be adjusted.

341 Rules of dosage adjustment to cytotoxic drugs are as follows:

342 Next cycle is delayed no more than 7 days: no adjustment

343 Next cycle is delayed more than 8 days and no more than 14 days:

- Cyclophosphamide (C) 25% reduction
- Doxorubicin (H) 25% reduction
- Vincristine (O) No adjustment
- Prednisone (P) No adjustment

344 Next cycle is delayed more than 14 days and no more than 21 days:

- Cyclophosphamide (C) 50% reduction
- Doxorubicin (H) 50% reduction

- Vincristine (O) No adjustment

- Prednisone (P) No adjustment

345 Besides hematological toxicity, other organ toxicity should be taken consideration into dosage
346 adjustment.

347 **8. Efficacy Assessments**

348 **8.1. Criteria Of Efficacy Assessments**

349 Complete remission (CR), partial remission (PR), stable disease (SD) or progressive disease (PD)
350 will be assessed according to 1998 Revised Response Criteria for indolent and aggressive
351 lymphoma by American and International Lymphoma Study Group as detailed in **attachment 1**.

352 **8.2. Efficacy Endpoints**

353 **8.2.1. Primary Efficacy Endpoint**

- 354 ● Disease-free survival (DFS), defined as the interval between the time of complete remission
355 and disease progression or death
- 356 ● 5-year DFS rate, defined as the percent of subjects whose DFS reach 5 years

357 **8.2.2. Secondary Efficacy Endpoints**

- 358 ● Overall response rate (ORR), defined as the percent of subjects who achieve complete
359 remission (CR), complete remission unconfirmed (CRu) and partial remission (PR)
- 360 ● Complete remission rate (CRR), defined as the percent of subjects who achieve complete
361 remission (CR)
- 362 ● Overall survival (OS), defined as the interval between randomization and death

363 **8.3. Schedule of Efficacy Assessments**

364 Disease assessments will be performed before randomization, after 2 cycles, 4 cycles, 6 cycles
365 and 8 cycles of R-CHOP chemotherapy, during follow-up, respectively. All subjects who complete
366 treatment or withdraw from the study must receive efficacy assessment. During follow-up period,
367 efficacy assessment will be performed every three months for two years after completion of
368 treatment, then every 6 months for three years, then every year.

369 **8.4. Methods Of Efficacy Assessments**

370 Visceral lesions must be assessed by contrast-enhanced CT or MRI scan. Superficial lesions must
371 be assessed by physical examination and documented in original medical record. Suspected
372 lesions could be screened by X-ray or ultrasound, which must be assessed by CT or MRI scan after
373 confirmed.

374 **9. Safety**

375 **9.1. Safety Endpoints**

376 **9.1.1. Vital Signs And Physical Examination**

377 Before randomization and treatment of every cycle, vital fhsigns and results of physical
378 examination must be documented.

379 The next 8 items must be performed before randomization and treatment of every cycle:

- 380 ● Physical examination
- 381 ● Heart rate
- 382 ● Blood pressure
- 383 ● Body temperature
- 384 ● Rate of Respiration

- 385 ● Body weight
- 386 ● ECOG performance status (details in attachment 2)
- 387 ● Signs of infection

388 **9.1.2. Laboratory Studies**

389 Before initiation of the study, the monitors will document the normal range of laboratory studies
390 of every involved laboratory. During the study, the next items must be performed:

- 391 ● Hematology: white cell counts and differential, hemoglobin, and platelet counts
- 392 ● Total bilirubin (both direct bilirubin and indirect bilirubin must be documented when the
393 total bilirubin elevates), alanine aminotransferase, aspartate aminotransferase, lactic
394 dehydrogenase, alkaline phosphatase, albumin, total protein and urea nitrogen
- 395 ● Serum creatinine and uric acid
- 396 ● electrolytes (sodium, potassium, calcium, and magnesium)
- 397 ● urinalysis (protein, glucose and erythrocyte)

398 **9.1.3. Electrocardiogram**

399 **9.2. Toxicity Assessment Of Adverse Events (AE) and Serious Adverse** 400 **Events (SAE)**

401 The investigator is required to make an assessment of the toxicity grade of each AE or SAE
402 reported. In this protocol, the toxicity grade of each AE/SAE will be evaluated according to the
403 National Cancer Institute (NCI) Common Toxicity Criteria for Adverse Events (CTCAE) version 3.0.

404 **10. Adverse Events**

405 The investigator or site staff will be responsible for detecting, documenting and reporting events
406 that meet the definition of an AE or SAE as outlined in Section 10.1 and Section 10.3.

407 **10.1. Definition of an AE**

408 Any untoward medical occurrence in a subject, temporally associated with the use of a medicinal
409 product, whether or not considered related to the medicinal product. An AE can therefore be any
410 unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or
411 disease (new or exacerbated) temporally associated with the use of a medicinal product. For
412 marketed medicinal products, this also includes failure to produce expected benefits, abuse, or
413 misuse.

414 All AEs and the toxicity grade of each AE/SAE according to the National Cancer Institute (NCI)
415 Common Toxicity Criteria for Adverse Events (CTCAE) version 3.0 must be documented in the CRF.
416 Clinical monitors must collect and verify detailed information of AEs when examining original
417 medical records. All AEs should be followed up until resolved. AEs which will not be resolved
418 during clinical observation such as loss of sight, neurotoxicity and deficiency of limbs are graded
419 as unsolved AEs, the blank for resolved time of which don't need to be filled in the CRF.

420 **10.2. Relationship of AEs**

421 The investigator must assess the relationship between AEs and study treatment or concomitant
422 drugs according to the following five categories:

- 423 1) Absolutely related: the occurrence of AEs is in accord with chronological sequence after
424 medical procedure and known side effects of suspected drugs, which can resolve after
425 suspension of the drugs and reoccur after reusing of the drugs.
- 426 2) Possibly related: the occurrence of AEs is in accord with chronological sequence after
427 medical procedure and known side effects of suspected drugs, which can also occur due to
428 the subject's disease status or other treatment methods.
- 429 3) Possibly unrelated: the occurrence of AEs is not in accord with chronological sequence after
430 medical procedure or known side effects of suspected drugs, which can also occur due to
431 the subject's disease status or other treatment methods.

432 4) Unrelated: the occurrence of AEs is not in accord with chronological sequence after medical
433 procedure but in accord with known side effects of non-study treatment drugs. The AEs can
434 also occur due to the subject's disease status or other treatment methods, disappear after
435 improvement of the disease and suspension of other treatment and reoccur after repeating
436 other treatment methods.

437 5) Unevaluated: there is no specific relationship between the occurrence of AEs and
438 chronological sequence after medical procedure. The type of AEs is similar to known side
439 effects of suspected drugs, which can also occur due to other drugs.

440 AEs which are in accord with the categories number 1, 2 and 5 above should be documented
441 as AEs of this study.

442 The incidence of AEs=Number of subjects who develop AEs/total subjects×100%

443 **10.3. Serious Adverse Events**

444 **10.3.1. Definition**

445 A serious adverse event is any untoward medical occurrence that, at any dose:

446 1) Results in death

447 2) Is life-threatening

448 3) Requires hospitalization or prolongation of existing hospitalization

449 4) Results in disability/incapacity

450 5) Is a congenital anomaly/birth defect

451 Hospitalization or prolongation of existing hospitalization for social reasons, selective operation,
452 examination or other treatment appointed prior to enrolment and events related to lymphoma
453 progression will not be reported as an SAE.

454 **10.3.2. Reporting of Serious Adverse Events**

455 All SAEs will be reported promptly in the SAE reporting tables. Initial reports of all SAEs regardless
456 of relationship to study treatment must be submitted to Sun Yat-Sen University Cancer Center
457 Ethics Committee (phone number: 020-87343135) within 24 hours by the investigator and the
458 follow-up information on previous reports must be submitted as soon as possible, including
459 outcome of SAEs. If the SAE is death, the follow-up information on previous reports is not
460 necessary.

461 **11. Rules of Withdrawal**

462 **11.1. Subjects withdraw from the study**

463 Subjects can withdraw from the study at any time for any reason without impact on the
464 investigator's right to treat disease for subjects. Based upon the interest of subjects, the
465 investigator has the right to request subjects to withdraw from the study for any reason including
466 concomitant disease, adverse events or treatment failure. The core group of clinical study
467 reserves the right to request subjects to withdraw from the study for deviation(s) from the
468 protocol, administrative reasons, or other effective or ethical reasons.

469 The last assessment for subjects must be performed and documented in the CRF regardless
470 of the time and reason for withdrawal. The reason for withdrawal from study participation must
471 be documented in the CRF. All documents related to subjects should be completed. Despite
472 withdrawal from the study, those subjects should be followed up and documented about their
473 diseases until withdrawal of informed consents.

474 For subjects who withdraw from the study due to concomitant diseases or adverse events,
475 the details must be documented in the CRF with other appropriate and valuable data attached.

476 **11.2. Premature Termination of the Study**

477 Reasons for premature termination of the study include external events, repetition of SAEs,
478 growing incidence of treatment-related death and slow enrolment in the study. All subjects will

479 be informed of premature termination of the study by written consents. Any subjects who decide
480 to discontinue participating in the study must report to the principal investigator.

481 **12. Rules of Follow-Up**

482 **12.1. Follow-up Period**

483 Starting after completion of treatment or withdrawal from the study for other reasons.

484 **12.2. Visit Scheduling**

485 Every three months for the first two years and then every six months until the study is
486 completed.

487 **12.3. Contents**

488 The contents of every follow-up visit include complaints of subjects, physical examination,
489 hematology, urinalysis, biochemistry and assessment of lymphoma. All of the results must be
490 documented in the original medical record. Disease assessments should also be documented in
491 the CRF.

492 **13. Data Analysis And Statistical Considerations**

493 **13.1. Hypotheses**

494 The primary endpoint is 5-year disease free survival rate. The null and alternative hypotheses are
495 designed with the goal of demonstrating the superiority of R-CHOP-14 over R-CHOP-21.

496 Superiority will be determined using the following hypothesis:

497 H0: 5-year disease-free-survival rates for R-CHOP-14 and for R-CHOP-21 are the same.

498 H1: 5-year disease-free-survival rates for R-CHOP-14 and for R-CHOP-21 are not the same.

499 **13.2. Study Design Considerations**

500 This prospective, multi-center, parallel, controlled, open-label, randomized (1:1) phase III study
501 compares R-CHOP chemotherapy repeated every 3 weeks (R-CHOP-21 group) with R-CHOP
502 chemotherapy repeated every 2 weeks (R-CHOP-14 group) in subjects with untreated
503 CD20-positive diffuse large B-cell lymphoma. The primary outcome is 5-year disease free survival
504 rate by intent-to-treat, and the study is designed to determine if R-CHOP-14 is superior to
505 R-CHOP-21 in the study population. Base on the reported 5-year disease-free-survival rate of 50%

506 for R-CHOP-21, a clinically meaningful improvement in 5-year disease-free-survival rate would be
507 12% for R-CHOP-14.

508 **13.2.1. Sample Size Assumptions**

509 The sample size calculation is based on the primary endpoint, 5-year DFS rate, with the following
510 assumptions:

- 511 ● 5-year disease-free-survival rate for R-CHOP-21 group: 50%
- 512 ● 5-year disease-free-survival rate for R-CHOP-14 group: 62%
- 513 ● Hazard Ratio: 0.69
- 514 ● a 1:1 randomization scheme
- 515 ● a 5% two-sided risk of erroneously claiming a difference in the presence of no true
516 underlying difference by log-rank test
- 517 ● a 80% chance of successfully declaring a difference in the presence of a true underlying
518 difference (power)
- 519 ● duration of accrual: 36 months
- 520 ● follow-up period: 60 months
- 521 ● 5% percent of cases drop

522 Under the above assumptions, a total sample size of 454 subjects is required with approximately
523 228 events observed. Up to December, 2010, a total of 262 subjects have enrolled in the study
524 with 138 subjects randomized to R-CHOP-21 group and 124 subjects randomized to R-CHOP-14
525 group in our early-phase study. Consequently, another 89 subjects and 103 subjects will be
526 required for R-CHOP-21 group and R-CHOP-14 group, respectively.

527 **13.2.2. Primary Efficacy Endpoint**

528 The primary efficacy endpoint of this study is 5-year disease free survival rate.

529 **13.2.3. Secondary Efficacy Endpoints**

530 The secondary efficacy endpoints of this study include overall response rate, complete remission
531 rate, overall survival and safety.

532 **13.3. Data Analysis Considerations**

533 **13.3.1. Analysis Populations**

534 The primary population will be the intent-to-treat (ITT) population, which is defined as all
535 subjects randomized to one of the two treatment groups. This ITT population will be the primary
536 population in reporting efficacy data.

537 A Per Protocol (PP) Population will exclude subjects with major protocol deviations that will
538 impact the efficacy outcome. The Per Protocol Population will be used in the primary endpoint
539 analysis to check the robustness of the result when using the ITT population. However, if the
540 number of subjects in the PP population is not more than 5% smaller than the ITT population, the
541 analysis will not be performed.

542 The safety population will include subjects who receive at least one dose of study treatment.
543 This population will be used for all safety measurements. In the analysis, subjects will be grouped
544 based on the treatment they receive regardless of how they are randomized.

545 **13.3.2. Analysis Data Sets**

546 The primary data set for efficacy will be based on the disease-free-survival (DFS) and overall
547 response rate (ORR) assessments. The primary data set for safety will be the adverse events and
548 the laboratory data sets.

549 The efficacy response will be assessed by the investigators and by the independent reviewers.
550 Data will be summarized for investigators to assess response as well as for independent reviewer
551 to assess response. Statistical inference for efficacy claims(s) will be based on the DFS and ORR
552 data assessed by the independent reviewers.

553 **13.3.3. Treatment Comparisons**

554 **13.3.3.1. Primary Comparisons of Interest**

555 The primary treatment comparison of interest will be R-CHOP-21 vs. R-CHOP-14. This will be
556 based on comparing the 5-year disease-free-survival rate when the total number of events
557 reaches 228 (from both arms) using the ITT population.

558 The primary efficacy endpoint will serve as a gatekeeper for the interpretation of treatment
559 comparisons for the 'inferential' secondary endpoints. If H0 is rejected at the 0.05 level, the
560 conclusion will be that there is a treatment difference between R-CHOP-21 and R-CHOP-14, and
561 the p-value for the 'inferential' secondary endpoints may be interpreted.

562 **13.3.3.2. Other Comparisons of Interest**

563 The secondary comparisons of interest will be R-CHOP-21 vs. R-CHOP-14, based on the overall
564 response rate (ORR) and overall survival (OS). The ORR and OS will be considered as ‘inferential
565 secondary endpoints’ and will be tested hierarchically only if the primary endpoint, 5-year DFS
566 rate, is significant. Each hypothesis will be tested at alpha level 0.05. If the 5-year DFS rate is
567 significant then the ORR will be tested and if significant, then the OS will be tested.

568 **13.3.4. Analysis Plan**

569 **13.3.4.1. Baseline Data**

570 Baseline characteristics will be summarized and described in a frequency list.

571 **13.3.4.2. Efficacy Analyses**

572 All the efficacy analyses will be based on the data assessed by the independent reviewer(s).

573 Data assessed by the investigator will also be summarized/analyzed for supportive purpose.

574 **13.3.4.2.1 Efficacy**

- 575 ● Complete remission rate: the percent of subjects who achieve complete remission and
576 complete remission, unconfirmed in the intent-to treat (ITT) population
- 577 ● Partial remission rate: the percent of subjects who achieve partial remission in the intent-to
578 treat (ITT) population
- 579 ● Disease progression rate: the percent of subjects whose disease progresses in the intent-to
580 treat (ITT) population

581 **13.3.4.2.2. Analysis of Efficacy**

582 Disease-free-survival (DFS) is defined as the interval between the time of complete remission and
583 disease progression or death. Overall survival (OS) is defined as the interval between
584 randomization and death. Both DFS and OS will be tested based on a two-sided test, with a
585 significance level of 0.05. Survival distributions will be estimated using the Kaplan-Meier method,
586 and survival curves will be compared using log-rank test.

587 The number and proportion of subjects who achieve complete remission, partial remission
588 and progressive disease will be provided. Pearson chi-square test or Fisher’s exact test will be
589 used to compare the proportion of subjects with complete remission, partial

590 remission and progressive disease for R-CHOP-21 vs. R-CHOP-14.

591 **13.3.4.3. Analysis of Safety**

592 Values of laboratory tests, vital signs and results of physical examination pretreatment, during
593 treatment and post-treatment must be documented in original medical record and the CRF. The
594 definition of adverse events has been detailed in previous section. Data of clinical symptoms,
595 signs and laboratory tests will be summarized according to NCI CTCAE grade (version 3.0).

596 Categorical data such as adverse events and serious adverse events will be summarized by
597 frequency and proportion of total subjects, which will be compared using Pearson chi-square test
598 or Fisher's exact test between R-CHOP-21 group and R-CHOP-14 group. Quantitative data such as
599 laboratory tests will be described using arithmetic average or median for central tendency and
600 standard deviation or interquartile range for distribution range, which will be compared using t
601 test or non-parametric test between the two groups.

602 **14. Materials For the Study**

603 All materials provided to study sites and investigators are as follows:

- 604 ● The study protocol
- 605 ● Informed consent
- 606 ● CRF
- 607 ● Manual for investigators
- 608 ● Archives of the principal study site

609 The investigators should sign and date on the receipt when receiving materials above.

610 **15. Ethical Considerations**

611 **15.1. Responsibility Of Investigators**

612 The investigators have the responsibility for guarantee of the clinical study's compliance with the
613 protocol, Chinese good clinical practice (GCP) guidelines and applicable laws and regulations.

614 **15.2. Informed Consent Process**

615 Prior to participation in the study, subjects must be informed about objectives, methods, possible
616 benefits, potential risks and possible discomforts of the study by investigators. They also should
617 be informed that participation in the study would be voluntary, they can withdraw from the study

618 at any time, there is no impact on the treatment of the disease whether they take part in the
619 study and their privacy will be protected.

620 Subjects or their legally acceptable representative should have enough time to read the inform
621 consent and raise queries. Written informed consent must be obtained from each subject, or
622 their legally acceptable representative, prior to participation in the study and a copy of the
623 informed consent would be reserved by subjects.

624 **15.3. Good Clinical Practice (GCP)**

625 This study will be conducted in accordance with the Declaration of Helsinki and Chinese Good
626 Clinical Practice (GCP). The study will be conducted only if be approved by the ethical review
627 committee of the principal study site. The investigators will guarantee that the study will be
628 conducted in accordance with applicable laws and regulations, scientific and ethical principles of
629 the People's Republic of China. If the protocol needs revision during the study, the revised version
630 must be reapproved by the ethical review committee of the principal study site. If new data
631 related to study treatment are discovered, the informed consent must be revised and the revision
632 must be reapproved by the ethical review committee of the principal study site and subjects.

633 **15.4 Protection of Subjects' Personal Data**

634 Data collected in the study are limited to the efficacy and safety related to study treatment. Data
635 will be collected and used in accordance with applicable laws and regulations.

636 **16. Administrative Requirements**

637 **16.1. Revision Of The Protocol**

638 Neither the investigator nor the applicant can revise the protocol without agreement of the
639 opposite side. All revisions of the protocol must be released by the applicant institution.

640 **16.2. Completion Of The Case Report Form (CRF)**

641 The investigator will confirm that subjects are enrolled in the study according to the contents of
642 the screening schedule. Examination and treatment must be performed in accordance with the
643 protocol and relevant results must be documented in original medical record and the observation
644 table of CRF. The table for concomitant drugs must be filled at the end of every cycle. After
645 completion of the study, the medical staff who fill the CRF and superior doctors must review

646 whether the CRF is consistent with original medical record. Data which deviate from reference
647 range markedly or lie out clinically acceptable range must be verified and illustrated by medical
648 staff who fill the CRF and superior doctors.

649 **16.3 Quality Control Of Data**

650 The following measures will be adopted to insure the integrity, accuracy and reliability of the
651 data:

- 652 ● Choose qualified and experienced study sites and investigators
- 653 ● Explain the protocol to investigators in detail by lectures or written materials and discuss
654 solutions to possible issues together
- 655 ● Verify the integrity, authenticity, accuracy and reliability of data by monitors at regular
656 intervals

657 **16.4. Study Monitoring**

658 **16.4.1 Objective**

- 659 ● Make sure the study is conducted in accordance with the currently approved protocol, ICH
660 GCP, and all applicable laws and regulations
- 661 ● Insure the integrity, reliability and coherence of data and coordinate the schedule between
662 study sites

663 **16.4.2. Contents**

- 664 ● Monitor and report the conduct of the study
- 665 ● Verify the eligibility and original data of all subjects
- 666 ● The CRFs are filled timely, accurately, completely and reliably
- 667 ● Study drugs are administered to subjects in accordance with the protocol
- 668 ● All AEs are recorded in the CRF
- 669 ● All mistakes are corrected and signed by investigators timely
- 670 ● Deliver various forms, materials and information including reference range of laboratory
671 tests to keep the testing system in each study site consistent with the principal study site
- 672 ● Whether the SAEs or death, which occur during the study, are related or unrelated to the
673 study, the responsible investigator and institution must adopt relevant measures

674 **16.5. Study Completion**

675 After the follow-up of the last subject is finished, the investigator will promptly inform the
676 applicant institution of the study.

677 **16.6. Study Termination And Site Closure**

678 The applicant institution reserves the right to terminate the study or close any study site at any
679 time for reasons including (but not limited to) the following:

- 680 ● Deviation(s) from the protocol
- 681 ● Inability to recruit enough subjects
- 682 ● Safety issues
- 683 ● Evident inferior efficacy

684 **16.7. Audit**

685 Representatives of applicant institution may conduct quality assurance audits of the site and
686 inspect all records related to the study. Drug administration agencies may conduct an audit at any
687 time during or after completion of the study. In the event of an audit, the study site will be
688 informed.

689 **17. Progression Of The Study**

690 A total of 454 subjects will complete the study in 8 years.

691 Initiation date of the study: January 2011

692 Completion date of the study: December 2018

693 **18. Appendices**

694 **18.1. Appendix 1**

695 **Standardized response criteria for non-Hodgkin's Lymphomas**

696 Bruce D. Cheson, Sandra J. Horning, Bertr Coiffier, Margaret A. Shipp, Richard I. Fisher, Joseph M.

697 Connors, T. Andrew Lister, Julie Vose, Antonio Grillo-López, Anton Hagenbeek, Fernando

698 Cabanillas, Donald Klippensten, Wolfgang Hiddemann, Ronald Castellino, Nancy L. Harris, James O.

699 Armitage, William Carter, Richard Hoppe, George P. Canellos. Report of an International

700 Workshop to Standardize Response Criteria for Non-Hodgkin's Lymphomas, Journal of Clinical

701 Oncology, Vol 17, Issue 4 (April), 1999: 1244

702 **Response Criteria:**

703 **Complete remission requires the following:**

- 704 1. Complete disappearance of all detectable clinical and radiographic evidence of disease and
705 disappearance of all disease-related symptoms if present before therapy, and normalization of
706 those biochemical abnormalities (eg, lactate dehydrogenase [LDH]) definitely assignable to NHL.
- 707 2. All lymph nodes and nodal masses must have regressed to normal size (≤ 1.5 cm in their
708 greatest transverse diameter for nodes. 1.5 cm before therapy). Previously involved nodes that
709 were 1.1 to 1.5 cm in their greatest transverse diameter before treatment must have decreased
710 to ≤ 1 cm in their greatest transverse diameter after treatment, or by more than 75% in the sum
711 of the products of the greatest diameters (SPD).
- 712 3. The spleen, if considered to be enlarged before therapy on the basis of a CT scan, must have
713 regressed in size and must not be palpable on physical examination. However, no normal size can
714 be specified because of the difficulties in accurately evaluating splenic and hepatic size. For
715 instance, spleens thought to be of normal size may contain lymphoma, whereas an enlarged
716 spleen may not necessarily reflect the presence of lymphoma but variations in anatomy, blood
717 volume, the use of hematopoietic growth factors, or other causes. The determination of splenic
718 volume or splenic index by CT scan are cumbersome and not widely used. Any macroscopic
719 nodules in any organs detectable on imaging techniques should no longer be present. Similarly,
720 other organs considered to be enlarged before therapy due to involvement by lymphoma, such as
721 liver and kidneys, must have decreased in size.
- 722 4. If the bone marrow was involved by lymphoma before treatment, the infiltrate must be cleared
723 on repeat bone marrow aspirate and biopsy of the same site. The sample on which this
724 determination is made must be adequate (≥ 20 mm biopsy core). Flow cytometric, molecular, or
725 cytogenetic studies are not considered part of routine assessment to document persistent
726 disease at the present time. These studies should only be incorporated into trials examining
727 important research questions.

728 **CR/unconfirmed (CRu) includes those patients who fulfill criteria 1 and 3 above, but with one**
729 **or more of the following features:**

- 730 1. A residual lymph node mass greater than 1.5 cm in greatest transverse diameter that has
731 regressed by more than 75% in the SPD. Individual nodes that were previously confluent must
732 have regressed by more than 75% in their SPD compared with the size of the original mass.
- 733 2. Indeterminate bone marrow (increased number or size of aggregates without cytologic or
734 architectural atypia).

735 **Partial remission requires the following:**

- 736 1. $\geq 50\%$ decrease in SPD of the six largest dominant nodes or nodal masses. These nodes or
737 masses should be selected according to the following features: (a) they should be clearly
738 measurable in at least two perpendicular dimensions, (b) they should be from as disparate
739 regions of the body as possible, and (c) they should include mediastinal and retroperitoneal areas
740 of disease whenever these sites are involved.
- 741 2. No increase in the size of the other nodes, liver, or spleen.
- 742 3. Splenic and hepatic nodules must regress by at least 50% in the SPD.
- 743 4. With the exception of splenic and hepatic nodules, involvement of other organs is considered
744 assessable and not measurable disease.
- 745 5. Bone marrow assessment is irrelevant for determination of a PR because it is assessable and
746 not measurable disease; however, if positive, the cell type should be specified in the report, eg,
747 large-cell lymphoma or low-grade lymphoma (ie, small, lymphocytic small cleaved, or mixed small
748 and large cells).
- 749 6. No new sites of disease.

750 **Stable disease is defined as less than a PR (see above) but is not progressive disease (see**
751 **below).**

752 **Relapsed disease (CR, CRu) requires the following:**

- 753 1. Appearance of any new lesion or increase by $\geq 50\%$ in the size of previously involved sites.
- 754 2. $\geq 50\%$ increase in greatest diameter of any previously identified node greater than 1 cm in its
755 short axis or in the SPD of more than one node.

756 **Progressive disease (PR, nonresponders) requires the following:**

757 1. $\geq 50\%$ increase from nadir in the SPD of any previously identified abnormal node for PRs or

758 nonresponders.

759 2. Appearance of any new lesion during or at the end of therapy.

760 **Response Criteria for Non-Hodgkin's Lymphoma**

Response Category	Physical Examination	Lymph Nodes	Lymph Node Masses	Bone Marrow
CR	Normal	Normal	Normal	Normal
CRu	Normal	Normal	Normal	Indeterminate
	Normal	Normal	> 75% decrease	Normal or indeterminate
PR	Normal	Normal	Normal	Positive
	Normal	$\geq 50\%$ decrease	$\geq 50\%$ decrease	Irrelevant
	Decrease in liver/spleen	$\geq 50\%$ decrease	$\geq 50\%$ decrease	Irrelevant
Relapse/Progression	Enlarging liver/spleen; new sites	New or increased	New or increased	Reappearance

761 **18.2. Appendix 2**

762 **ECOG performance status**

Grade	ECOG
0	Fully active, able to carry on all pre-disease performance without restriction
1	Restricted in physically strenuous activity but ambulatory and able to carry out work of a light or sedentary nature, e.g., light house work, office work
2	Ambulatory and capable of all selfcare but unable to carry out any work activities. Up and about more than 50% of waking hours
3	Capable of only limited selfcare, confined to bed or chair more than 50% of waking hours
4	Completely disabled. Cannot carry on any selfcare. Totally confined to bed or chair
5	Dead
