eFigure. Sensitivity Analysis Examining Facility-Level Correlation of Cystoscopy Frequency Between Low-Risk (x-axis) and High-Risk (y-axis) Patients

This supplementary material has been provided by the authors to give readers additional information about their work.
**eFigure.** Sensitivity analysis examining facility-level correlation of cystoscopy frequency between low-risk (x-axis) and high-risk (y-axis) patients. The data presented here is based on the raw data, without adjusting for co-variates or reliability. Only facilities with at least 10 low-risk and 10 high-risk patients were included. The line represents the same cystoscopy frequency for low- and high-risk patients. The shaded area represents facilities where low-risk and high-risk patients undergo cystoscopy at comparable rates (i.e., absolute difference of less than 1 cystoscopy over 2 years). Green dots represent facilities with a statistically significantly higher frequency for high-risk versus low-risk patients. Cystos = cystoscopies.
