## **eMethods**

### *Scheduling and dosing of trastuzumab and chemotherapy regimens*

T+C-treated patients received one of the following regimens, either preoperatively or post-operatively: (1) AC/TH: Adriamycin/Cytoxan (every 2 weeks for 4 cycles) followed by Taxol and concurrent trastuzumab (weekly for 12 weeks); (2) TCH: Taxotere/carboplatin with concurrent trastuzumab (every 3 weeks for 6 cycles), or (3) TC-H: Taxotere/Cytoxan with concurrent trastuzumab (every 3 weeks for 4 cycles). All patients received additional trastuzumab alone (every 3 weeks) to complete a full year of therapy.

### *PBMC processing and handling*

Between 25 and 30 mL of whole blood was collected from each study participant in 5 heparinized collection tubes (BD Bioscience). Shortly after phlebotomy (<4-6 hours), PBMCs were isolated using density gradient centrifugation (i.e., Ficoll-Paque method; Fisher Scientific) according to manufacturer's instructions, and cryopreserved at  $10 \times 10^6$  cells/mL in 10% DMSO in human serum at  $-80^\circ\text{C}$ ; all PBMCs were utilized within 4 weeks of cryopreservation. Viability upon thaw was between 60 and 80%. Briefly, PVDF membrane plates (Mabtech Inc.) were coated overnight with anti-IFN- $\gamma$  capture antibody. Cryopreserved PBMCs were thawed into pre-warmed DMEM+5% human serum, and prepared at  $1 \times 10^6$  PBMCs/mL in said medium. After plates were washed and blocked, PBMCs were plated in triplicate ( $2 \times 10^5$  cells/well), and incubated at  $37^\circ\text{C}$  for 24-36 hours with either HER2 peptide(s), medium alone, or positive control (refer to **Methods** section).

### *Flow cytometry*

PBMC were suspended in FACS buffer (PBS+1% FCS+0.01% azide) and PE/FITC/Cy5 -conjugated mouse anti-human CD3, CD4, CD25, T-bet, GATA-3, IFN- $\gamma$ , or subclass-matched controls (BD Bioscience) were used to determine relative PBMC immunophenotype. Intracellular staining with anti-FoxP3 using FoxP3 fixation/permeabilization kit (Biolegend) was performed according to manufacturer's instructions. Analysis was performed using BD LSR-II cytometer, and datasets analyzed using CellQuest Pro software.

#### *Functional contribution of Th1 vs. Th2 subtypes*

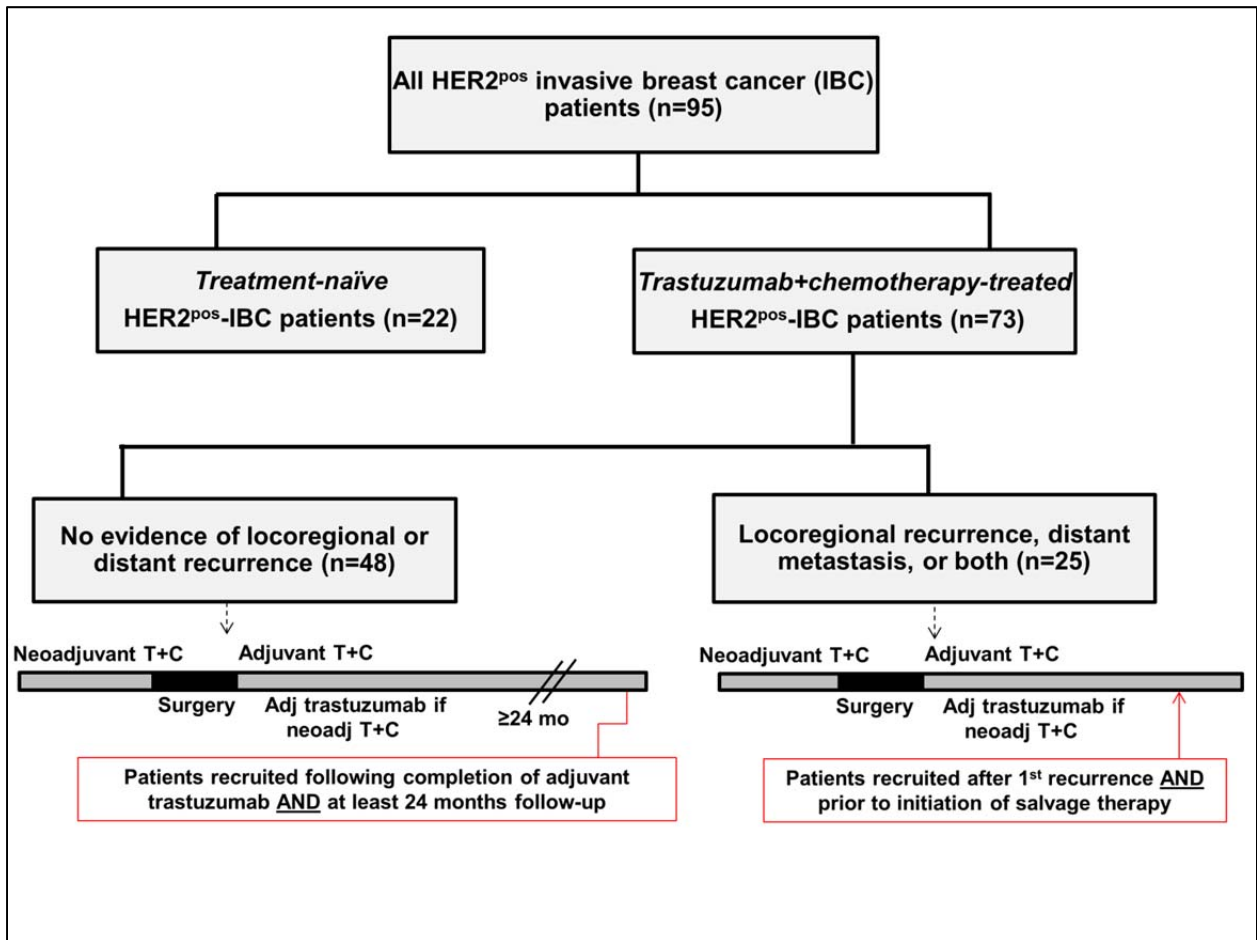

PBMCs were resuspended at  $1.2 \times 10^6$  cells/mL in DMEM + 5% human serum in 24-well plates, and pulsed with HER2-class II peptide mix (24  $\mu\text{g/mL}$ ). Unstimulated and anti-CD3/CD28 antibody-pulsed PBMCs from each donor served as negative and positive control, respectively. Following incubation for 6 hours at 37°C, protein transport inhibitor Brefeldin-A (Sigma Aldrich; 10  $\mu\text{g/ml}$ ) was added to each sample, and incubated overnight. Following washing, cells were stained with anti-human CD4 for 30 min at room temperature. Cells were subsequently washed twice, fixed and permeabilized using Foxp3 fixation/permeabilization kit (Biolegend) according to manufacturer's instructions, and stained with anti-T-bet, anti-GATA-3 and anti-IFN- $\gamma$  (Biolegend) for 30 min. After incubation, cells were washed and analyzed on a BD LSR-II cytometer.

#### *Statistical analysis*

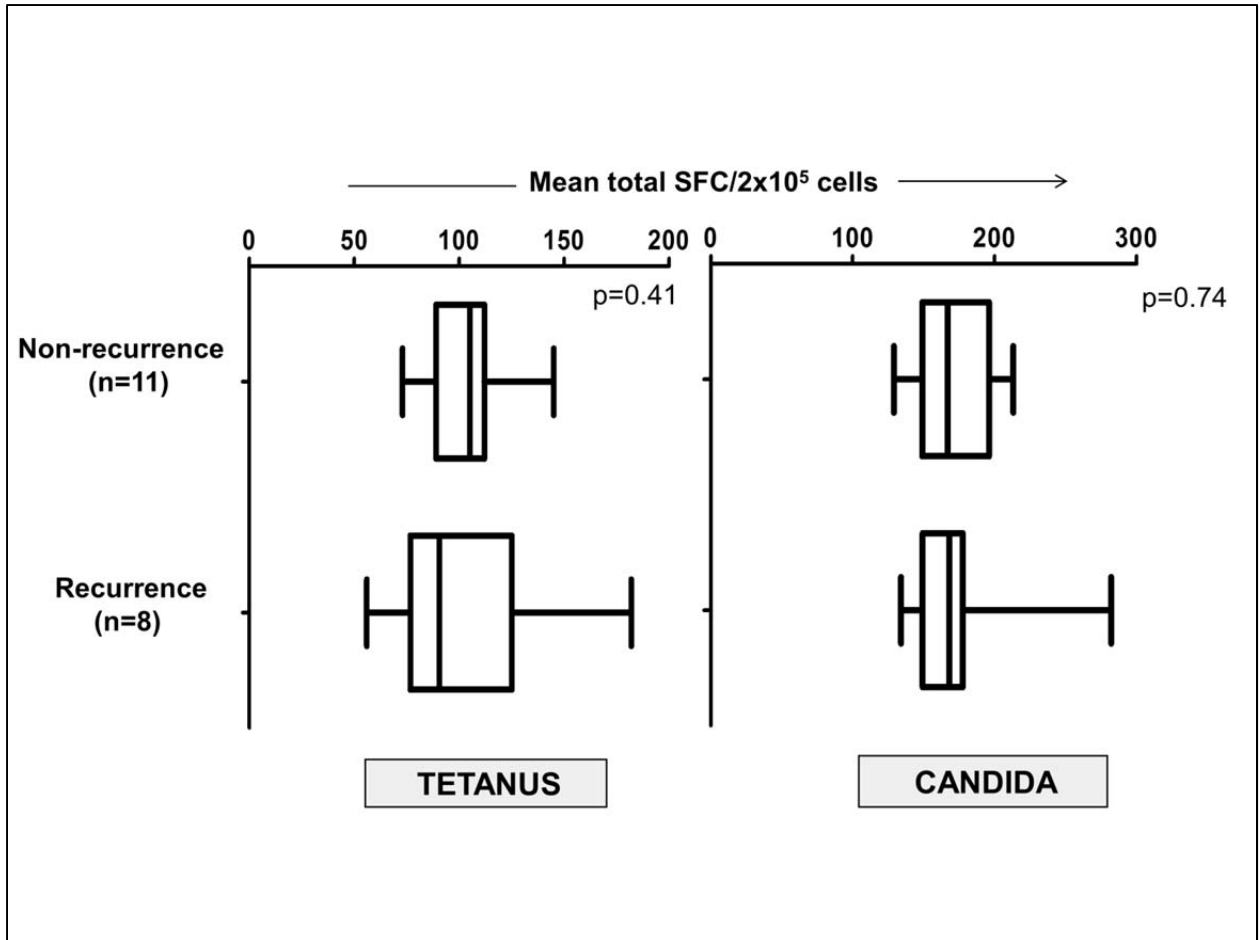

Descriptive statistics summarized distributions of patient characteristics and immune response variables. Comparisons between non-recurrent and recurrent HER2<sup>pos</sup>-IBC cohorts were performed as indicated: (a) 2-group/univariate testing — unpaired Student's t-test (parametric continuous), Wilcoxon rank-sum test (non-parametric continuous), and  $\chi^2$  tests (categorical); (b) >2-group testing — one-way

ANOVA with post-hoc Bonferroni testing. Variables with  $p < 0.1$  on univariate testing were entered into a forward, stepwise multivariable logistic regression model ( $p < 0.05$  for entry) to determine independent correlates to recurrence (binary outcome yes/no). Missing data for post-neoadjuvant pathologic response status ( $n=36$ ) and LVI ( $n=12$ ) were imputed using the Markov chain Monte Carlo method. Five imputation data sets were created and five sets of analyses were combined per Rubin's formula.

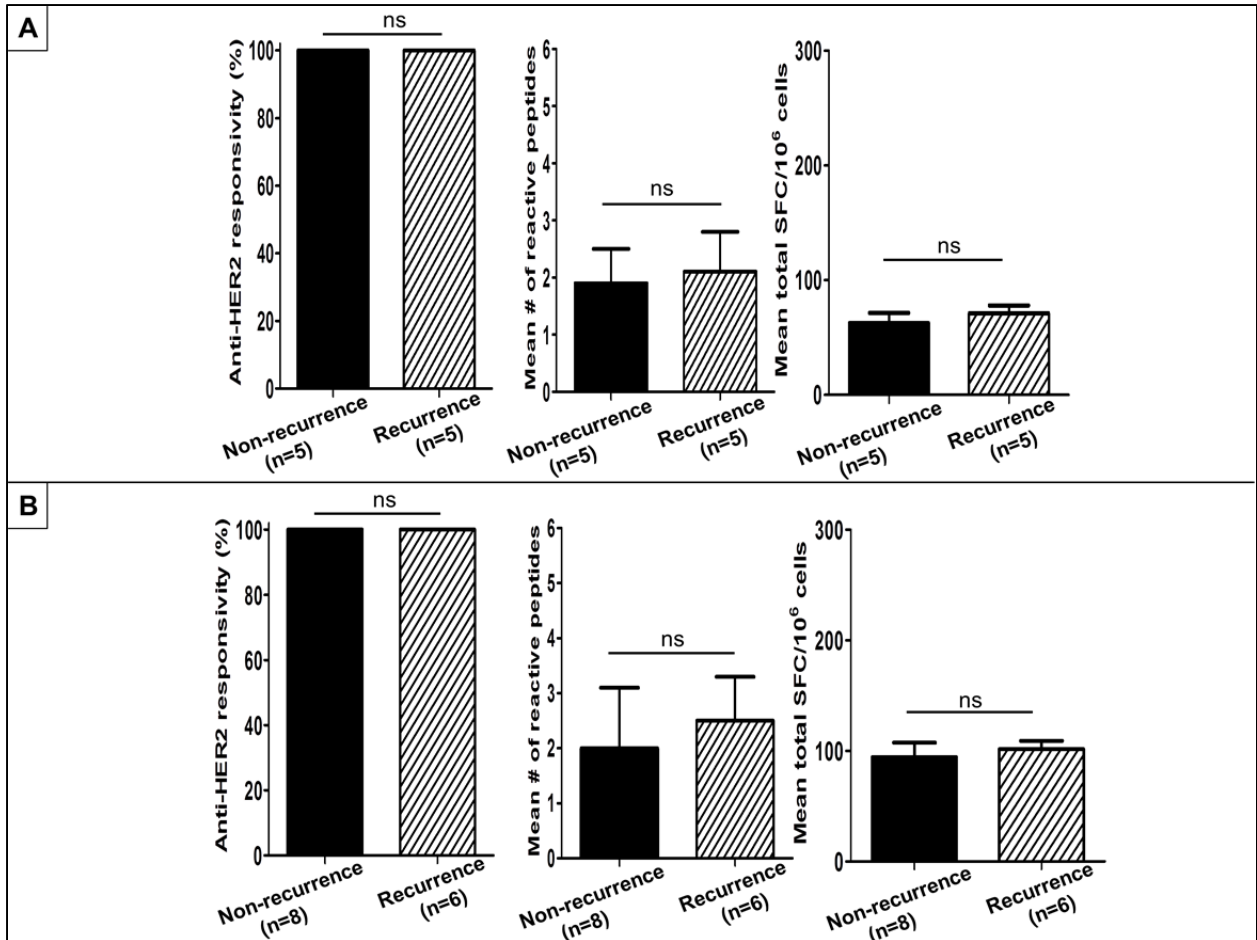

Univariate disease-free survival (DFS) estimates were examined by Kaplan-Meier methodology, stratifying by anti-HER2 Th1 responsivity and other covariates. Observations of non-recurrent patients (minimum 24 month follow-up) were censored at last known follow-up. To analyze the instantaneous hazard of all variables and control for varied follow-up, Cox proportional hazards modeling was performed. The assumptions of the Cox model were assessed, including interactions and proportionality of hazards over time.  $P < 0.05$  was considered statistically significant. All tests were two-sided. Analyses were performed using SPSS version 22 (IBM Corp).

**eFigure 1. Flow diagram of study populations.** In this study, 95 HER2<sup>pos</sup> breast cancer patients were enrolled; all tumors were histologically confirmed invasive breast cancer with HER2 overexpression (3+ or 2+/FISH-positive). Time-points at which blood was drawn are indicated in red callout boxes. Median follow-up in the trastuzumab and chemotherapy (T+C)-treated cohort was 44 (IQR 31) months.

**eFigure 2.** PBMCs from non-recurrence and recurrence cohorts did not differ significantly in IFN- $\gamma$  production to recall stimuli tetanus toxoid (*left*) and *Candida albicans* (*right*) by ELISPOT. Results presented as median  $\pm$  interquartile range (IQR) IFN- $\gamma$  SFC/2x10<sup>5</sup> cells.

**eFigure 3. Circulating HER2-specific Th2 and T<sub>reg</sub> functional contributions. (A)**

Circulating HER2-specific IL-4 production — a surrogate for Th2 function — does not vary between non-recurrence and recurrence cohorts, when assessed by anti-HER2 Th1 responsivity, repertoire, and cumulative response. Results expressed as proportion or mean ± SEM. **(B)** HER2-specific IL-10 production — a surrogate for T<sub>reg</sub> function — is similar between non-recurrence and recurrence cohorts across all three Th1 metrics. Results expressed as proportion or mean ± SEM.

**eTable 1. Demographic and tumor-related characteristics of study populations.**  
 Age, race, AJCC pathologic stage, hormone receptor status, and time from completion of trastuzumab (when applicable) for study populations.
