
eFigure. Primary Care Visit and Perforated Appendicitis Rate for Children 18 Years or Younger

This supplementary material has been provided by the authors to give readers additional information about their work.
Children who had a primary care visit in the previous year are less likely to present with perforated appendicitis. Odds ratios and 95% confidence intervals for perforation are shown for any visit within 1 to 3, 1 to 6, 1 to 12, 3 to 12, and 6 to 12 months of presentation with appendicitis.
